

Abstract

CABLE RESTRAINING DEVICE

5 A detachable binding device comprising a bracket including a base portion and a
slotted projection having a first slot and a second slot aligned in parallel with the first slot
between the first slot and the base portion. The binding device further includes a self-
gripping fastening strip. The fastening strip passes through the first slot to form a first
wrap around a length of a cable to hold the cable against the slotted projection. The
10 fastening strip then passes through the second slot to form a second wrap over the first
wrap and the length of the cable for secure retention of the cable against the slotted
projection by setting the fastening strip into a self-gripping arrangement. After formation,
the binding device may be detached from the length of the cable and the bracket by
disrupting the self-gripping arrangement of the fastening strip and withdrawing the
15 fastening strip from the second slot and the first slot to release the length of the cable from
contact with the slotted projection.
